

MIGHTY FPS HEATMAPS – See Red. Turn it Green.

MIGHTY FPS HEATMAPS

See Red. Turn It Green.

45 FPS → 120 FPS

Version 1.0.0

Thank you for purchasing Mighty FPS Heatmaps! A premium Mighty Maps extension that will show you exactly where your performance takes a hit by displaying FPS readings as both a topdown heatmap and within the sceneview as FPS spheres pinpointed on the objects in the scene which were present when the reading was recorded.

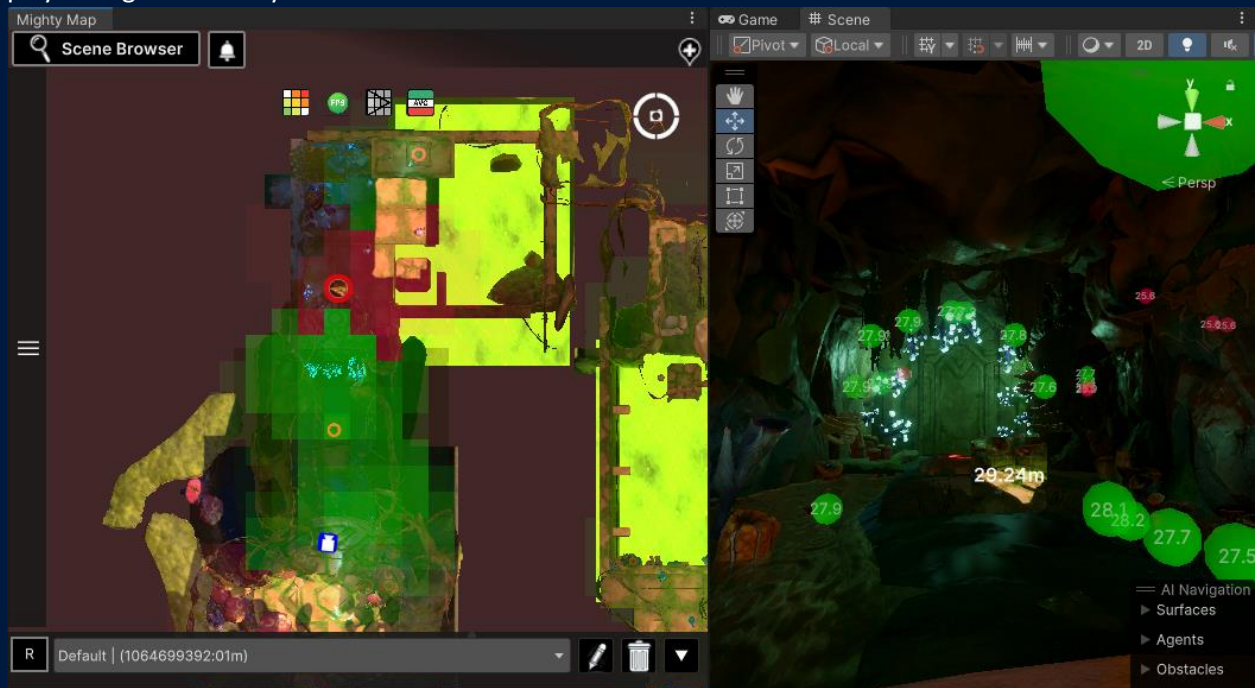

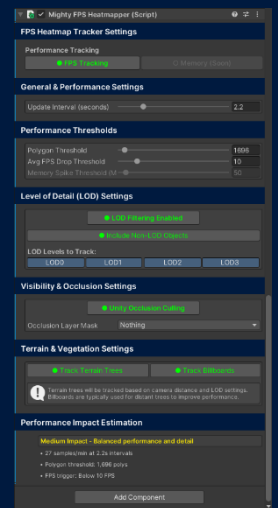

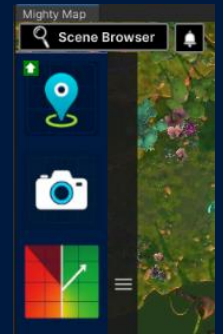

As it is an extension, you **MUST** have Mighty Maps first installed before this asset will do anything. Don't worry, it's free! Get it here:

<https://assetstore.unity.com/packages/tools/utilities/mighty-Maps-minimap-bookmarks-screenshots-and-more-267512>

BUT WAIT – Mighty Maps is now pre-bundled with this asset, so you only need to check the above link if you think the core asset itself has updates – otherwise, MIGHTY FPS HEATMAP updates will always included the latest version of Mighty Maps. This should make staying in sync a lot easier.

GETTING STARTED

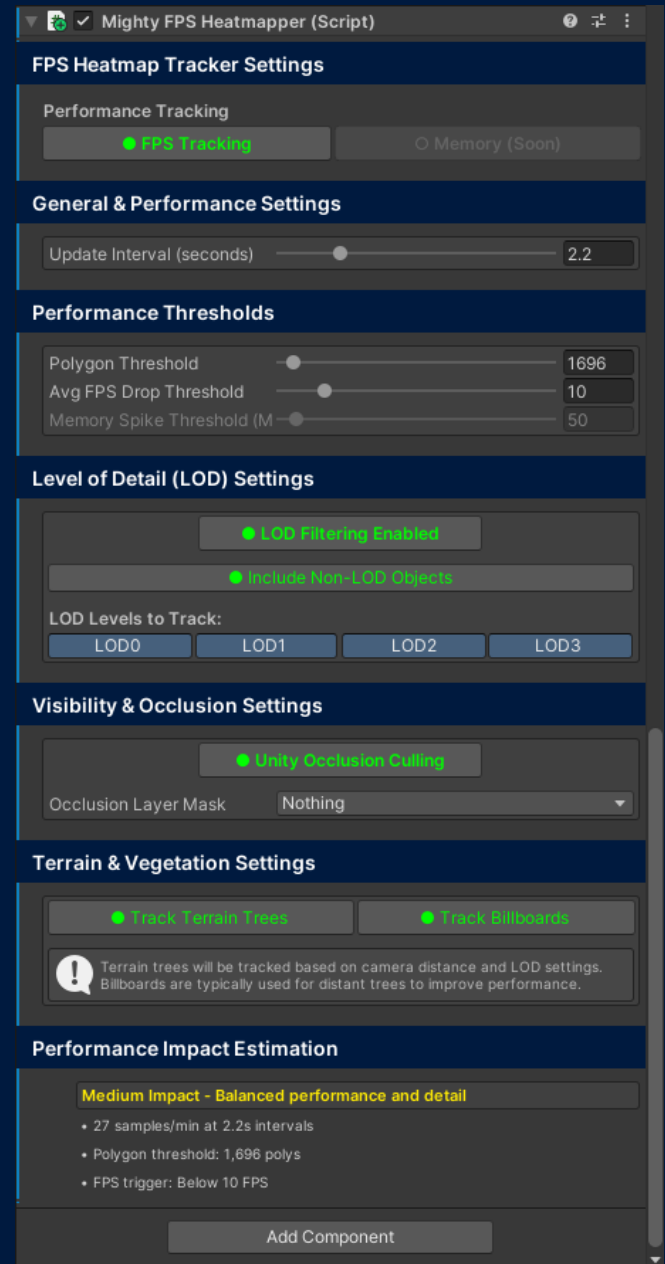

1. You must first have Mighty Maps installed as it is the core engine that allows you to view everything in the Mighty Map, go get it from the asset store for free (see link above).
 2. Don't forget to give Mighty FPS Heatmaps a review on the Store!
 3. Make sure Mighty FPS Heatmaps is installed in the **MightyMaps/Modules** folder
 4. To check if it's installed right, click the "Abilities" panel and make sure you see the FPS Heatmaps icon ABOVE the "More Modules" list. To be extra sure, click it, it should go Grey (disabled). Click it again and it should turn white again (enabled).
 5. Try it out! Find your main character and add the Mighty FPS Heatmaps script to the GameObject. Enable Track FPS (you'll notice Track Memory is greyed out, this is a future feature). The Update Interval is how often it will record data, in seconds. Setting a lot of objects to a value of 1 means you'll record their data every second, this means a lot of data might get collected if you play long enough!
- NOTE: Only add Heatmap tracking to your main Camera!
6. Make sure you click the "R" record toggle on the plathrough panel. It should be RED, otherwise NOTHING WILL RECORD.
 7. Play your scene a bit! After you stop, it should automatically select the latest playthrough data and your view should be similar to this!

MIGHTY FPS HEATMAPPER COMPONENT

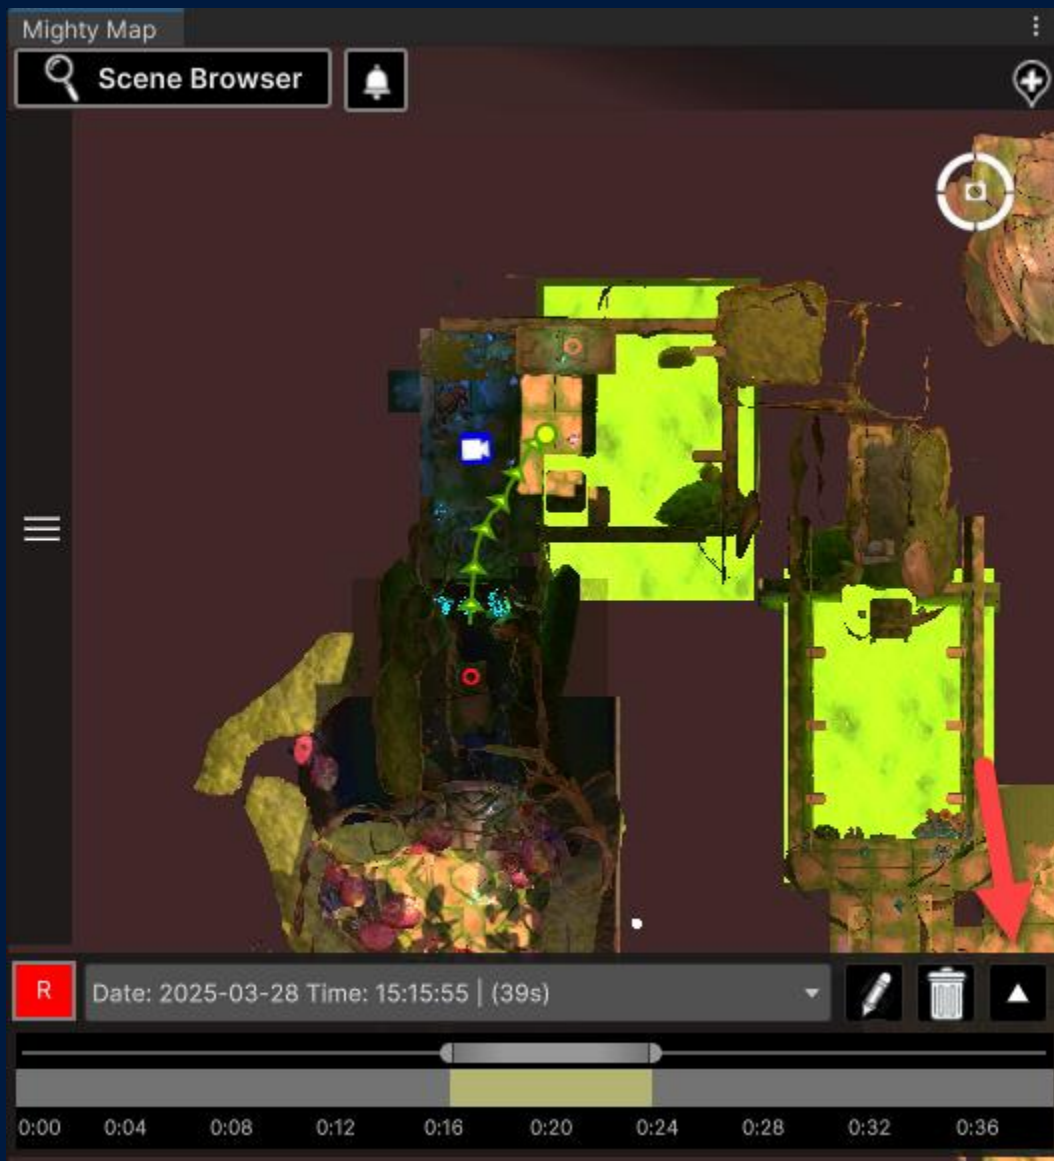

Adding FPS Heatmaps to an Object couldn't be easier! Simply "Add Component" and choose the "Mighty FPS Heatmapper" component.

- **Tracking Options:** Track either the **FPS** or **Memory Footprint (coming soon!)**
- **Update Interval** - How often, in seconds, we record data. Unless you're testing something very sensitive, I would keep this value 1 second or higher otherwise it will collect a LOT of data (which is saved to disk, also a huge amount of data may cause editor lag) Also note these update intervals are unique per object being tracked.
- **Polygon Threshold** – Only record objects with poly counts ABOVE this number.
- **FPS Drop Threshold** – Over the course of a running 10 second window, if the frames tank by this amount it will force a recording.
- **LOD Filtering** – Ignore far out objects, and whether to track objects that don't have an LOD at all
- **Occlusion Settings** – If you have this set up on your scene it will be able to contain the FPS readings to ignore objects that are being occluded from view.
- **Terrain Settings** – Vegetation can certainly cause FPS to dive, Billboards are generally safe so you might consider disabling that.

MIGHTY FPS HEATMAPS – See Red. Turn it Green.

Playthrough Panel Tip!

This is technically a Mighty Maps feature but I would like to remind you that you can “open” up the panel to reveal a timeline slider. This is a Min/Max slider so you can actually isolate specific time ranges, and even slide it around and reveal the progression of the paths in a somewhat animated fashion.

It is on the roadmap to add more enhancements here soon.

MIGHTY FPS HEATMAPS – See Red. Turn it Green.
