

MIGHTY TRACKING – Stop Guessing. Start Fixing.

MIGHTY TRACKING

Stop Guessing. Start Fixing.
Every Path. One View.

Verion 1.2.0

Thank you for purchasing Mighty Tracking! A premium Mighty Maps extension that will accelerate your scene optimization and physics debugging like never before possible.

As it is an extension, you MUST have Mighty Maps first installed before this asset will do anything. Don't worry, it's free! Get it here:

<https://assetstore.unity.com/packages/tools/utilities/mighty-Maps-minimap-bookmarks-screenshots-and-more-267512>

BUT WAIT – Mighty Maps is now pre-bundled with this asset, so you only need to check the above link if you think the core asset itself has updates – otherwise, MIGHTY TRACKING updates will always included the latest version of Mighty Maps. This should make staying in sync a lot easier.

GETTING STARTED

1. You must first have Mighty Maps installed as it is the core engine that allows you to view everything in the Mighty Map, go get it from the asset store for free (see link above).
2. Don't forget to give Mighty FPS Heatmaps a review on the Store! It helps so much.
3. Make sure Mighty Tracking is installed in the **MightyMaps/Modules** folder
4. To check if it's installed right, click the "Abilities" panel and make sure you see the Tracking icon ABOVE the "More Modules" list. To be extra sure, click it, it should go Grey (disabled). Click it again and it should turn white again (enabled).
5. Try it out! Find your main character and add the Mighty Tracking script to the GameObject. Enable both Track Position and Track FPS and choose a color for the visualizations. The Update Interval is how often it will record data, in seconds. Setting a lot of objects to a value of 1 means you'll record their data every second, this means a lot of data might get collected if you play long enough!
6. Make sure you click the "R" record toggle on the plathrough panel. It should be RED, otherwise NOTHING WILL RECORD.
7. Play your scene a bit! After you stop, it should automatically select the latest playthrough data and your view should be similar to this!

OBJECT TRACKING (Static)

Adding Tracking to an Object couldn't be easier! Simply "Add Component" and choose the "Mighty Tracking" component.

- **Update Interval** - How often, in seconds, we record data. Unless you're testing something very sensitive, I would keep this value 1 second or higher otherwise it will collect a LOT of data (which is saved to disk, also a huge amount of data may cause editor lag) Also note these update intervals are unique per object being tracked.
- **Tracking Color** - What color this object will be visualized as. Note that it will record this value in the data and (at the moment) can't be changed afterwards.
- **Camera Capture** – Yes, you can have it snap a render everytime it tracks a position in the path!
- **Is Main Camera** – Important feature, this will ensure that all UI and Postprocessing is enabled on this camera but will ONLY work with the main view – if enabled on secondary cameras it will actually show the main camera on the wrong path.
- **Capture Camera** – Specify exactly which camera will be our source, tip: you can either have one directly on the same object, or child an empty object below it, add the camera, then adjust the Y value and the camera will be slightly above this objects POV.
- **Quality Presets** – Try hitting the Auto Detect first and see if you like it. For main character captures higher quality might be justified, but if you're just testing monsters or projectile paths, you might consider a much lower resolution for those renders. Yes, HDRP and URP are supported.
- **Custom Resolution** -- You can force the renders to be a certain size. If not, it'll mimic the size of the Game editor window (free aspect) or whatever resolution setting you chose in the game editor window.
- **Compression** – Whether to store the byte data as a PNG or JPG with various compression levels.
- **Storage Estimation** – Since image captures COULD get out of hand, this handy calculator helps. It's not perfect since image file size varies based on color complexity.

OBJECT TRACKING (Spawned)

```
2 references
32 public void LoadProjectile()
33 {
34     if (m_LoadedProjectile != null)
35         return;
36
37     m_LoadedProjectile = m_ProjectilePool.GetNew();
38     m_LoadedProjectile.transform.SetParent(transform, false);
39     m_LoadedProjectile.transform.localPosition = muzzleOffset;
40     m_LoadedProjectile.transform.localRotation = Quaternion.identity;
41
42     m_LoadedProjectile.gameObject.AddComponent<MightyTracking.MightyTracker>();
43     var mt = m_LoadedProjectile.gameObject.GetComponent<MightyTracking.MightyTracker>();
44     mt.enabled = true;
45     mt.trackingColor = Color.white;
46     mt.updateInterval = 0.1f;
47 }
```

It's also very easy to programatically add a tracker to a GameObject. Typically you'll want to do this for things you spawn, such as bullets or monsters etc.

Add the component to the GameObject:

```
yourGameObject.gameObject.AddComponent<MightyTracking.MightyTracker>();
```

Then configure it by getting the component and manipulating the properties:

```
var mt = m_LoadedProjectile.gameObject.GetComponent<MightyTracking.MightyTracker>();  
mt.enabled = true;  
mt.trackingColor = Color.white;  
mt.updateInterval = 0.1f; //Time in seconds for updates
```

You can disable it to pause or stop the tracking. You don't need to do any special cleanup if the object is destroyed, it will be destroyed with it along with it's cycle to track data.

SCENEVIEW TRAILS

Seeing the path in 2D is very useful, but wouldn't it be even better to visualize it in full 3D in the scene itself? Yes, yes it would! And it looks really, really cool. A strobe effect is added to visualize the direction the object took (since arrows weren't possible).

Check the settings to adjust these to your preference:

- Thickness - How wide the line is.
- Intensity - How strong the "strobe" effect is (keep it low)
- Speed - How fast the strobe cycles through.
- Fade Distance - How far away until the lines start fading away.
- Opacity Curve - How the fade will actually occur (probably best to leave this as is but you can have fun experimenting)

MIGHTY TRACKING – Stop Guessing. Start Fixing.

MIGHTY TRACKING – Stop Guessing. Start Fixing.

Sceneview Camera Captures

Hover over these little magic circles and the capture will burst into view. Click on it and it will save the render into a file with a generic unique name (feel free to save as).

More enhancements to these captures are coming in the very new future, watch for updates!

Playthrough Panel Tip!

This is technically a Mighty Maps feature but I would like to remind you that you can “open” up the panel to reveal a timeline slider. This is a Min/Max slider so you can actually isolate specific time ranges, and even slide it around and reveal the progression of the paths in a somewhat animated fashion.

So cool!

In a future update I plan to add some controls that will “Play” this timeline, possibly on a loop.

MIGHTY TRACKING – Stop Guessing. Start Fixing.
